

Certified concrete on the road

Pan Mixers SA introduced the Fiori concrete batching vehicle (CBV), an upgrade of the popular Fiori self-loading mixer, to the market. An advanced weighing system and controller enable the CBV to calculate the precise weight of aggregates being loaded and saves time during batching.

A USB port on the device enables measurements to be downloaded electronically.

The weighing-system enables contractors to effectively produce certified concrete, and enables them to deliver it to rural areas without fixed batching plants. The CBV is very manoeuvrable thanks to four-by-four drive and three steering mechanisms, consisting of standard front wheel for moving forward; crab steering for moving sideways; and pinch steering to turn sharp corners. Furthermore, a slump detection system allows the operator to achieve a desired slump for each mix design.
